FOREIGN-LANGUAGE AND ENGLISH DICTIONARIES
IN THE PHYSICAL SCIENCES AND ENGINEERING:
A SELECTED BIBLIOGRAPHY 1952 TO 1963

Tibor W. Marton

ABSTRACT

The bibliography lists over 2800 unilingual, bilingual, and polyglot dictionaries, glossaries and encyclopedias in the physical sciences, engineering and technology published during the past twelve years. The majority of the titles cited have English as the source or target language, or are dictionaries giving definitions in English. The bibliographic entries are arranged in 49 subject classes; within each subject, the entries are listed alphabetically by language, and within each language group by author. Forty-seven foreign languages are represented in the compilation. Lists of abbreviations and reference sources, and detailed author, language, and subject indexes complement the publication.

1. INTRODUCTION

The rapid pace of technological progress in the United States, the Soviet Union, the United Kingdom, West Germany, France, Japan, and many other countries throughout the world has quickened interest in scientific and engineering terminology. Even the less developed countries, wanting to keep abreast of the scientific literature of the technologically advanced nations, have substantially increased their lexicographic effort.

The publishing of glossaries and dictionaries, responding to the law of supply and demand, has been further stimulated by four major factors: 1) the obsolescence of a fast-developing technology, 2) the interdisciplinary character of modern science, 3) the need for quick dissemination of scientific and technical information, and 4) the corresponding need for standardization of national and international terminology.

The proliferation of technical dictionaries and encyclopedias in turn has increased the need for up-to-date bibliographic aids designed to guide the literature searcher and user to the best and latest language tools. While a few excellent bibliographies have been published in the last decade (e.g., the compilations of UNESCO, Zaunmüller, Malclès), none has been geared to the specific requirements of the American specialist. With this in mind, the compiler has attempted to provide an up-to-date bibliography oriented toward the American user. The by-product of an acquisition program aimed at the expansion of the technical dictionary collection of the National Bureau of Standards Library, the compilation comprises unilingual defining glossaries, dictionaries, encyclopedias and bi- or multilingual dictionaries in the physical sciences and technology listed in a subject-language arrangement.

Within the limits set by time and budget, considerable effort was made to locate and peruse as many entries as possible; however, the compilation does not claim to be all-inclusive. The compiler will welcome suggestions for information on important publications which may have been overlooked.

Selection criteria. The chronological scope -- the past twelve years -- was chosen because bibliographic coverage of the field is quite adequate up to the early 1950's.

The principal criterion for the selection of entries -- although evaluation per se was not intended -- was the usefulness of the cited work to the English-speaking scientific community within the range expressed by the title: physical sciences and engineering. The biological sciences and their applied fields (medicine, agriculture, etc.) were excluded unless there was an overlap between the physical and biological disciplines, e.g., biophysics, biochemistry, radiology, agricultural machinery.

As a rule, general language dictionaries and encyclopedias (English or foreign) were not included, although most of the reputable compilations in this category list a fair proportion of scientific and technical terms; the large number of such dictionaries would have considerably increased the size of the publication. In any case, this category can easily be located in the better-known reference books, publishers' catalogs, etc. (See Bibliographic References, pp.167-9).

In view of the English-language orientation of this compilation, the second major criterion for the inclusion of bilingual and polyglot dictionaries was that English be either the source language or one of the target languages. Unilingual defining dictionaries in languages other than English were included only if their subject areas were marked by a scarcity of bilingual or multilingual titles, and if they met the additional criteria of quality, comprehensiveness, or special interest in the physical sciences and/or technology (e.g., Metrology, Engineering Standards, Cryogenics, Superconductivity). Interlingual and polyglot dictionaries lacking English as one of the languages (e.g., a German-French geophysics dictionary or a Russian-Chinese-Japanese technical dictionary) were excluded, however valuable in other respects.

Literature search. An extensive search was made of the relevant literature, including specialized, national and international bibliographies, publishers' catalogs and announcements, and serials in this field. Emphasis was placed on significant titles issued in the past twelve years. A few exceptions were made to this chronological scope in order to include earlier titles outstanding for their excellence or pertinence to their particular subject.

The literature search was not extended to locate a significant portion of glossaries in textbooks, monographs, handbooks, serials, etc. Pertinent lists of terms in publications of these types were included only if they came easily to the compiler's attention. One of the reasons for not covering fully these glossaries -- aside from the size of the task -- is that the better ones in these categories are often incorporated into a major compilation.

Subject analysis. This aspect presented minor problems. Some dictionaries have titles that are not self-explanatory or fully descriptive of their contents; a substantial number cover more than one major subject class and express such multiple coverage in the title; others comprise a whole range of subjects without expressing all of them in the main title. For the convenience of the reader, it was decided that dictionaries listing terms in two or three distinct technical fields would be entered under each major topic; those referring to more than three subjects would be printed under general and comprehensive designations such as Materials, Science, Technology.

Production. The processing technique developed out of a modest effort to explore the possibilities offered by mechanized handling of a medium-sized but rather complex bibliography. For the benefit of those

interested in the mechanization aspects, it is perhaps appropriate to touch upon the main features of the system adopted: key-punched cards, machine sorting by subject and language code, tabulating, and photographically reduced offset printing.

Ten columns were reserved for five 2-digit codes on each punched card: three codes for subjects, one for language, and one for card identification, leaving the rest of the punched card for the text of the entry. Card sets having two or, less frequently, three subject affiliations were mechanically duplicated, sorted and listed in the appropriate subject class. For 2800 individual entries with approximately 40 per cent subject duplication, about 10,000 cards had to be keypunched, interpreted, sorted, and tabulated. In the final printout, of course, the code designations were suppressed.

Programming and computer treatment were considered but abandoned in the early stages of planning because of limited project funds and time, and because of the complexity of a task involving the permutation and alphabetization of over 2800 entries representing 49 subject areas and 48 languages. Permuted title printout (Keyword-in-Context) was also rejected for obvious reasons: the keywords in the various languages would be scattered all over the alphabet (e.g., Chemistry, Chimie, Kemia, Khimiia, Quimica), thus defeating the very purpose of the KWIC arrangement. The additional listing of all entries by language, though easily feasible with machine sorting and tabulating, was given up due to practical considerations, i.e., the almost double printing costs.

It may be worthwhile here to point out some of the advantages of the selected system: it facilitates error correction and updating for possible future cumulation or rearrangement; it requires no manual retyping of entries to be listed in more than one place in the bibliography; it lends itself to the production of special printouts for specific requests, such as listings by languages or by author.

Arrangement. The main body of the bibliography covers 49 major subject areas in the physical sciences, engineering and technology listed in alphabetical order. Each subject area is subdivided by language groups, also arranged alphabetically. Within each language group, the entries are arranged alphabetically by author or title.

Entries. Most entries in this bibliography consist of individual or corporate author(s), original title, abbreviated translation of foreign titles, imprint, Library of Congress card number, and approximate number of terms contained in the dictionary.

Author(s). Since dictionaries and encyclopedias are often the result of cooperative effort, and also for the sake of brevity, designations such as "editor", "compiler", etc. have been omitted throughout. If more than two personal authors are involved, only the name of the senior author is listed, followed by an "et al" notation. In general, preference was given to individual compilers over corporate author(s). In cases in

which no individual or corporate author was cited, the entry was listed by title. Finally, if the corporate author was the same as the publisher, the publisher's name was omitted in the imprint.

Titles of entries. As a rule, titles are given in the vernacular to insure accurate and easy identification. For the same reason, abbreviations or omission of parts of original titles are sparingly used, even if the original title is in English. However, English translations of foreign-language titles (appearing in parentheses following the original title) are abbreviated in accordance with the List of Abbreviations on pp. 162-6. The Library of Congress transliteration system for Slavic languages and romanization system for Oriental languages have been used throughout.

Abbreviations and symbols. Translated titles, language information, publishers' names, etc. have been abbreviated in accordance with the Lists of Abbreviations. The adoption of abbreviations, especially in the translated titles, reduced very considerably the length of the entries and therefore, the number of cards to be punched, handled, and tabulated. It is hoped that this minor inconvenience to the reader will be understood.

The names of languages have been abbreviated to a two-letter mnemonic symbol, e.g., EN(GLISH), FR(ENCH), RU(SSIAN), JA(PANESE). (See List of Language Abbreviations, p. 162). The asterisk (*) preceding the language abbreviation means the language into which the dictionary translates. Thus, the abbreviated translation of a "two-way" title, e.g., a German-English, English-German dictionary, appears in the compilation as:

(*GE*EN D).

A "one-way" glossary, e.g., an English-Russian glossary, is listed as:

(EN*RU GL).

Defining dictionaries published exclusively in foreign languages are identified by an abbreviated note following the translated title: "RU DEFS", or "GE DEFS", etc., meaning that the terms are defined in Russian or German, not in English.

Imprint and Other Data. The original title and its abbreviated translation are followed by the series statement and edition statement wherever applicable, place of publication, publisher's name, date of publication, pages or number of volumes, Library of Congress card number whenever available, and, when known, the number of terms contained in the dictionary. EXAMPLE:

PALOTAS, L. ET AL. MUSZAKI MECHANIKA. (ENG.MECH.
D, *HU*EN*GE*RU) (MUSZ. ERT. SZ, NO.4) ED2.
BUDAPEST, TERRA, 1959. 167P. 59-40060. 1200T.

This bibliographic citation sequence is the same throughout, although some of the elements may be missing, depending on the publication itself or on its availability for inspection.

Various editions. In the case of several editions of the same title, usually the latest available edition has been listed. In view of the practice of certain publishers of calling a slight re-manipulation of the original work a "new" or subsequent edition, it is suggested that the reader using this bibliography for acquisition purposes compare the various editions carefully. Naturally, an attempt was made to locate and inspect all cited dictionaries, at least in the libraries of the Greater Washington area, or to obtain detailed bibliographic information on elusive entries by correspondence. However, these efforts were not always successful; as a result, some titles lack complete bibliographic information.

Glossaries in serials and monographs. For the relatively few entries representing glossaries published in serials, the names of periodicals have been abbreviated in accordance with the Chemical Abstracts List of Periodicals and the Publications and Report Manual of the National Bureau of Standards. Glossaries appearing as a part or appendix in monographs are so identified in the bibliographic citation.

Type font. The limitations of available key-punching and tabulating equipment necessitated some departures from the typeset bibliographic format. Another aspect of these limitations is the substitution of commas for apostrophes in Western languages and for apostrophe-like symbols in the romanization systems for Oriental languages and in the transliteration systems for Slavic languages.

Indexes. It was decided not to employ serial numbers for entry identification; such numbers offer no clue to the subject or author of an entry and involve a great deal of scanning time. Furthermore, the very nature of the bibliography's arrangement (by subject and language within the subject) facilitates location of the desired entry and encourages browsing. For ease of perusal, dictionaries which cover terms in two or three distinct technical fields are listed under each major subject class in the bibliography; however, in the author and language indexes, page references are only to the entry under the major subject class to avoid duplication of look-up.

Author index. In order to facilitate location of the entries in library catalogs and publishers' announcements, etc. -- especially for the purpose of acquisition and/or inspection -- an Author Index is supplied on pp.170-9. However, since various reference tools, publishers' lists and library catalogs may use different cataloging and bibliographic systems, the reader is cautioned to consider carefully alternate choices of entry.

Language index. A detailed Language Index is provided on pp.180-3 indicating page and subject references for uni- and bilingual entries. Index references for languages contained in the polyglot dictionaries include -- in addition to page and subject -- the symbol P0 and the first word of the entry. For entries in English, French, German, and Russian, the index gives only page references due to the fact that these

languages are represented in all subject fields and in all polyglot sections; the perusal of a detailed index for this group of languages would be too laborious and time-consuming for the reader.

Subject index. In addition to the broad classes of subjects in the physical sciences, engineering, and technology which form the very structure of the bibliography and are listed in the table of contents, a detailed Subject Index is provided on pp. 184-9 for readers interested in specific, narrower topics. These index entries include subject groups at the lower hierarchical level, such as names of materials (e.g., Glass, Rubber, Steel) or instruments (e.g., Oscilloscope, Microscope, Potentiometer).

Acknowledgments. It is a great pleasure to acknowledge the encouragement given to the project from its inception to completion by Miss Sarah Ann Jones, Chief Librarian of the National Bureau of Standards.

It goes without saying that a compilation of this nature would not have been possible without the generous help of many specialists; the bibliography has been strengthened through the assistance and counsel of many scientists, librarians, linguists and translators in the Washington area. To all of these, I wish to express my sincere gratitude.

Invaluable help in locating, romanizing and translating Chinese, Japanese, and Korean titles was given by Dr. Osamu Shimizu, Miss Joan Wu, and Mr. Chi Wang, all of the Library of Congress.

The compiler is particularly indebted to the following staff members of the National Bureau of Standards: Dr. Don I. Mittleman, Chief of the Computation Laboratory, and Mr. William W. Youden of the Information Technology Division, for helpful comments and advice on the technique chosen for production; Mr. Kermit Nelson of the Computation Laboratory for his tireless efforts to improve the key-punching and tabulating operations; Mr. John E. Carpenter, Chief of the Publications Section, for suggestions on printing and distribution aspects; Mr. Conrad F. Peters, Chief of the Graphic Arts Section, and staff members in that section, for assistance in the preparation of the manuscript-printout for photo-offset printing. Special thanks are due to Miss Stella J. Pridgen and Mrs. Natalie J. Goldenberg of the Library of the National Bureau of Standards for the valiant service rendered in the seemingly endless and arduous task of searching, typing, proofreading, supervision of tabulating operations, and general editorial work.

THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards is a principal focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. Its responsibilities include development and maintenance of the national standards of measurement, and the provisions of means for making measurements consistent with those standards; determination of physical constants and properties of materials; development of methods for testing materials, mechanisms, and structures, and making such tests as may be necessary, particularly for government agencies; cooperation in the establishment of standard practices for incorporation in codes and specifications; advisory service to government agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; assistance to industry, business, and consumers in the development and acceptance of commercial standards and simplified trade practice recommendations; administration of programs in cooperation with United States business groups and standards organizations for the development of international standards of practice; and maintenance of a clearinghouse for the collection and dissemination of scientific, technical, and engineering information. The scope of the Bureau's activities is suggested in the following listing of its four Institutes and their organizational units.

Institute for Basic Standards. Electricity. Metrology. Heat. Radiation Physics. Mechanics. Applied Mathematics. Atomic Physics. Physical Chemistry. Laboratory Astrophysics.* Radio Standards Laboratory: Radio Standards Physics; Radio Standards Engineering.** Office of Standard Reference Data.

Institute for Materials Research. Analytical Chemistry. Polymers. Metallurgy. Inorganic Materials. Reactor Radiations. Cryogenics.** Office of Standard Reference Materials.

Central Radio Propagation Laboratory.** Ionosphere Research and Propagation. Troposphere and Space Telecommunications. Radio Systems. Upper Atmosphere and Space Physics.

Institute for Applied Technology. Textiles and Apparel Technology Center. Building Research. Industrial Equipment. Information Technology. Performance Test Development. Instrumentation. Transport Systems. Office of Technical Services. Office of Weights and Measures. Office of Engineering Standards. Office of Industrial Services.

* NBS Group, Joint Institute for Laboratory Astrophysics at the University of Colorado.

** Located at Boulder, Colorado.
